

Section 14 - Vue Animation

Why Vue Animation Is Required?

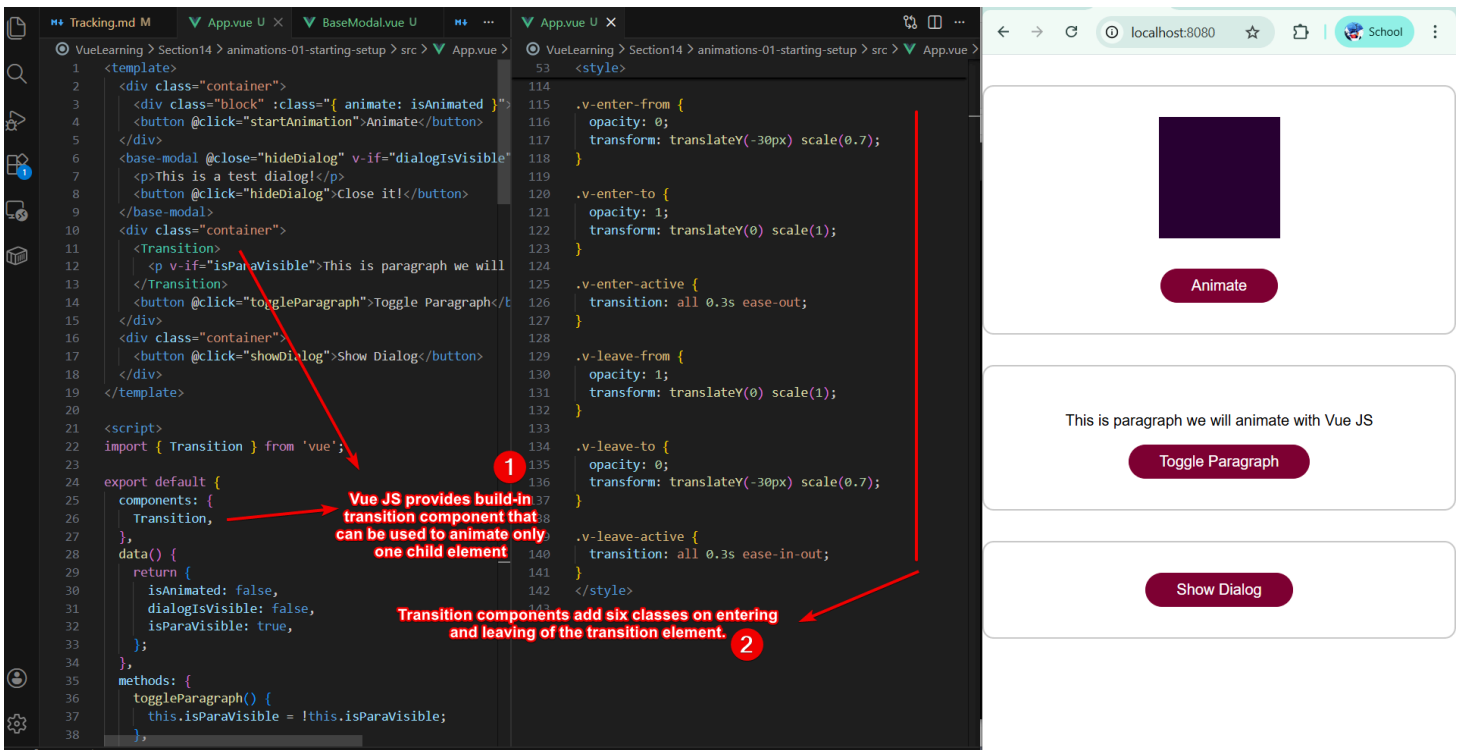

When we apply CSS animation using animation or transition property then these properties applies only when element appears on screen, not when element leave the screen.

To tackle this, Vue offers transition tag that allows only one child element. This transition tag monitors element appears using various classes.

Transition Component

As mentioned above build-in Transition Components adds six classes.

Two important modifications:

- 1. Named Transition Component:** using `name` attribute on `Transition` component, you can make this component named `Transition` block and now you can define `.para-enter-from`, `.para-enter-to`, `.para-enter-active` and so on... to define transitions while `para` is defined as `name="para"` in `Transition` component.
- 2. Custom Transition Classes:** You can also customize these transition classes by passing your custom classes in `enter-from-class=""`, `enter-to-class=""` attributes in `Transition` component.

Named Transition To Animate Modal

Tracking.md M

App.vue U

BaseModal.vue U X

Section14.md U

VueLearning > Section14 > animations-01-starting-setup > src > components > BaseModal.vue > {} style scoped > .model-enter-active

```
1 <template>
2   <div class="backdrop" v-if="isActive" @click="$emit('close')"></div>
3   <Transition name="model">
4     <dialog open v-if="isActive">
5       <slot></slot>
6     </dialog>
7   </Transition>
8 </template>
9
10 <script>
11 import { Transition } from 'vue';
12
13 export default {
14   props: ['isActive'],
15   components: {
16     Transition,
17   },
18   emits: ['close'],
19 };
20 </script>
21
22 <style scoped>
23   .model-enter-active {
24     animation: fade-scale 0.3s ease-out;
25   }
26
27   .model-leave-active {
28     animation: fade-scale 0.3s ease-out reverse;
29   }
30
31   .backdrop {
32     position: fixed;
33     top: 0;
34     left: 0;
35     width: 100%;
36     height: 100vh;
37     z-index: 10;
38     background-color: rgba(0, 0, 0, 0.75);
```

Animate

This is paragraph we will animate with Vue JS

Toggle Paragraph

Show Dialog

Here we are using named Transition Component and using it we are adding entering and leaving classes.

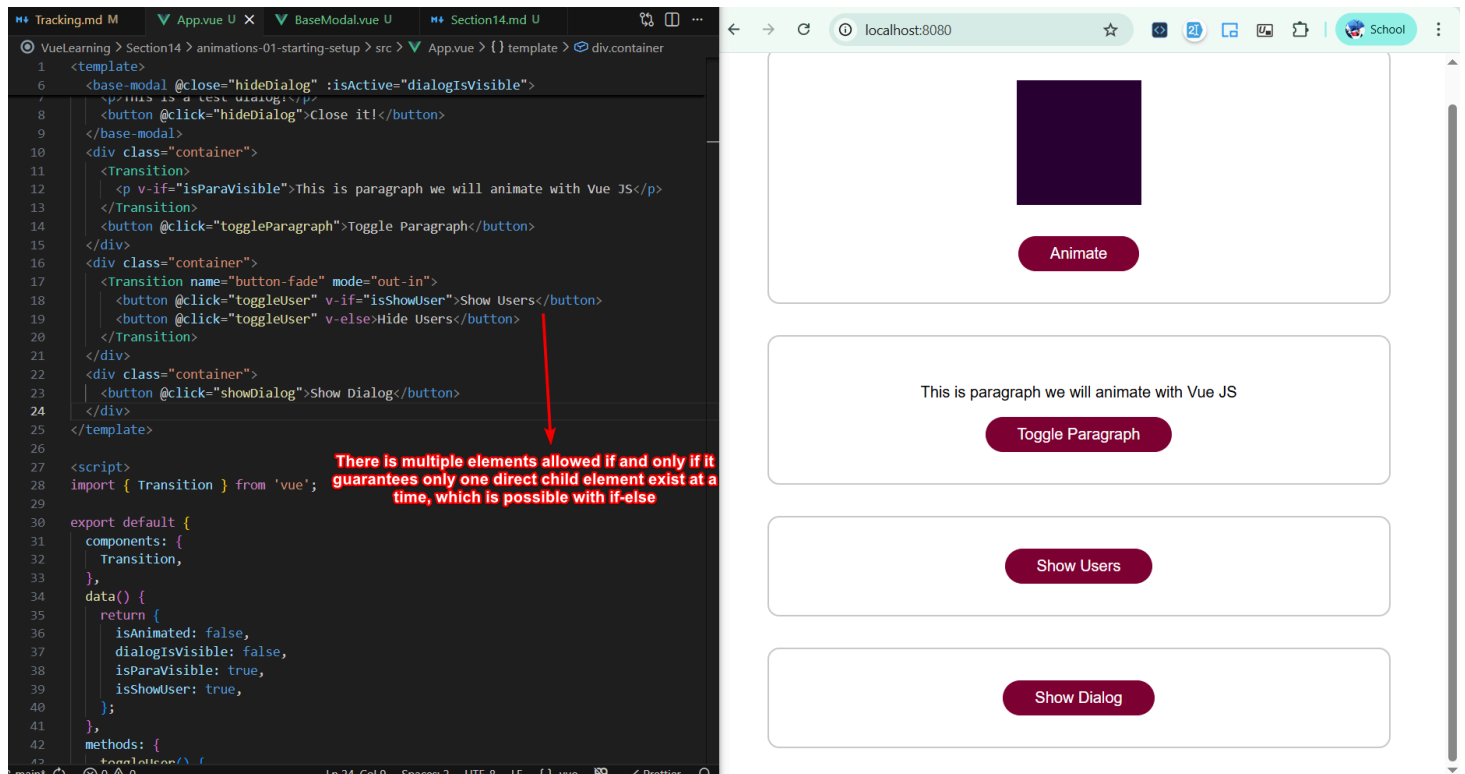

Take a note, we can also use CSS animation in classes added by Vue's Transition component.

Tip

Always remember, `Transition` component works if and only if there is **atmost one** direct child element.

Multiple Child Elements in Transition Component

`mode` attribute defines how animation/transition will kick in, with `out-in` mode, animation first applies to leaving element, and then appearing element.

Transition Events

`Transition` components provides various events such as `beforeEnter`, `beforeLeave`, `Leave`, `Enter`, etc. that you can utilize to enter custom functions.

```
<Transition name="model" @before-leave="" @enter="" @leave="">
  <dialog open v-if="isActive">
    <slot></slot>
  </dialog>
</Transition>
```

TransitionGroup

`TransitionGroup` is being used to apply transition effect on a list of items.

```
VueLearning > Section14 > animations-01-starting-setup > src > components > UserList.vue {} template > section
1 <template>
2 <section>
3   <transitionGroup tag="ul" name="user-list">
4     <li v-for="user in this.users" :key="user" @click="removeUser(user)">
5       {{ user }}
6     </li>
7   </transitionGroup>
8   <form @submit.prevent="addUser">
9     <input type="text" name="userName" id="userName" ref="userName" />
10    <button>Submit</button>
11  </form>
12 </section>
13 </template>
14
15 <script>
16 import { TransitionGroup } from 'vue';
17
18 export default {

1
TransitionGroup is been used to apply transition to the list items

2
Similar to Transition Component,
TransitionGroup also add *-enter-from, *-enter-to,
*-enter-active, *-leave-from, etc. classes
