

Section 17 - Vue Authentication and Authorization

I didn't get Firebase Web API in project settings so I skipped this part. Also, most of the time we will not use Firebase for database.

Section 18 - Deployment

Most of the part you already know like you need to run `build` command to create `dist` folder that should be uploaded.

SPA Vs. Non-SPA

In non-SPA app, browser will **look for** `products` **folder** when user access tabishsajwani.com/products.

In SPA-app, browser will **ignore** `/products` **route and everytime return index file** that will handle `/products` route itself like loading products component/page.
